

IN THE CLAIMS:

1. A method for treating a neoplasm comprising cells, comprising:
administering to said neoplasm an amount of a mutant human herpes simplex virus
5 which is oncolytic to cells in said neoplasm, wherein said virus does not produce a
functionally active wild-type glycoprotein C polypeptide.

Sub-B1
2. A method of claim 1, wherein said virus comprises a deletion in the UL44 gene
which codes for glycoprotein C.

10
3. A method of claim 1, wherein said virus comprises a deletion of amino acids 33-
123 in the UL44 gene.

Sub-B2
15 4. A method of claim 2, wherein said virus comprises an insertion in the UL44 gene which
codes for glycoprotein C.

5. A method of claim 1, wherein the parental strain of said virus is KOS.

6. A method of claim 1, wherein said virus is gC-39.

20
Sub-B3
7. A method of claim 1, wherein said virus is impaired in its ability to infect, or attach
to the surface of, cells as compared to the wild-type parental strain.

8. A method of claim 1, wherein said virus is impaired in its ability to infect neuronal
25 cells as compared to the wild-type parental strain.

9. A method of claim 1, wherein said cancer is an adenocarcinoma.

10. A kit comprising a mutant human herpes simplex virus which is oncolytic to cells in a neoplasm, wherein said virus does not produce a functionally active wild-type glycoprotein C and a chemotherapeutic agent.

5

Sub. B4 11. A pharmaceutical composition comprising a mutant human herpes simplex virus wherein said virus does not produce a functionally active wild-type glycoprotein C₁ polypeptide coded for by the UL 44 gene, and a sterile physiologically balanced solution.

10

12. A pharmaceutical composition as described in claim 11 wherein said mutant human herpes simplex virus is present at 10^4 – 10^{12} pfu.

13. A pharmaceutical composition as described in claim 12 further comprising a chemotherapeutic agent.

15
